

2011 Day 1 Question 1A (GPP)

a.  $\oint \mathbf{B} \cdot d\mathbf{l} = \mu_0 I_{enc}$   
 $2\pi r B = \mu_0 I_0 \frac{r^2}{r_0^2}$

$B = \frac{\mu_0 I_0}{2\pi} \frac{r^2}{r_0^2} \quad r < r_0$

$B = \frac{\mu_0 I_0}{2\pi r} \quad r > r_0$

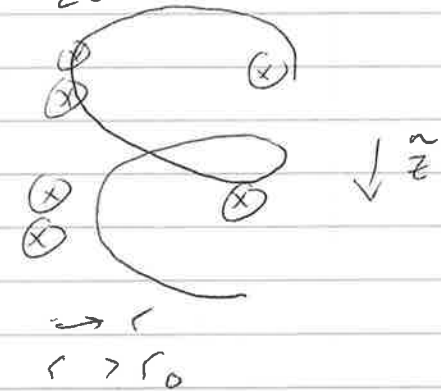

b.  $\mathbf{v} = \frac{\mathbf{E} \times \mathbf{B}}{B^2}$  with drift velocity  $\mathbf{v}_d = \frac{c}{B} \nabla B \sim \frac{B \times \nabla B}{B^2}$

$\uparrow$  drift  $-\hat{z}$

$r_L = \frac{mv}{eB}$

$r > r_0$

c.  $E > 0$ , add  $\mathbf{E} \times \mathbf{B}$  drift. Points in  $\hat{z} \times \hat{\phi} = -\hat{r}$  for both

d.  $\mathbf{E} \times \mathbf{B}$  radial drift will vanish exactly at  $r = 0$ .

Yes I think they should "reside"  $r=0$ , though that is obviously not a stable position - it will inevitably drift with gyromotion along  $-\hat{z}$ .
